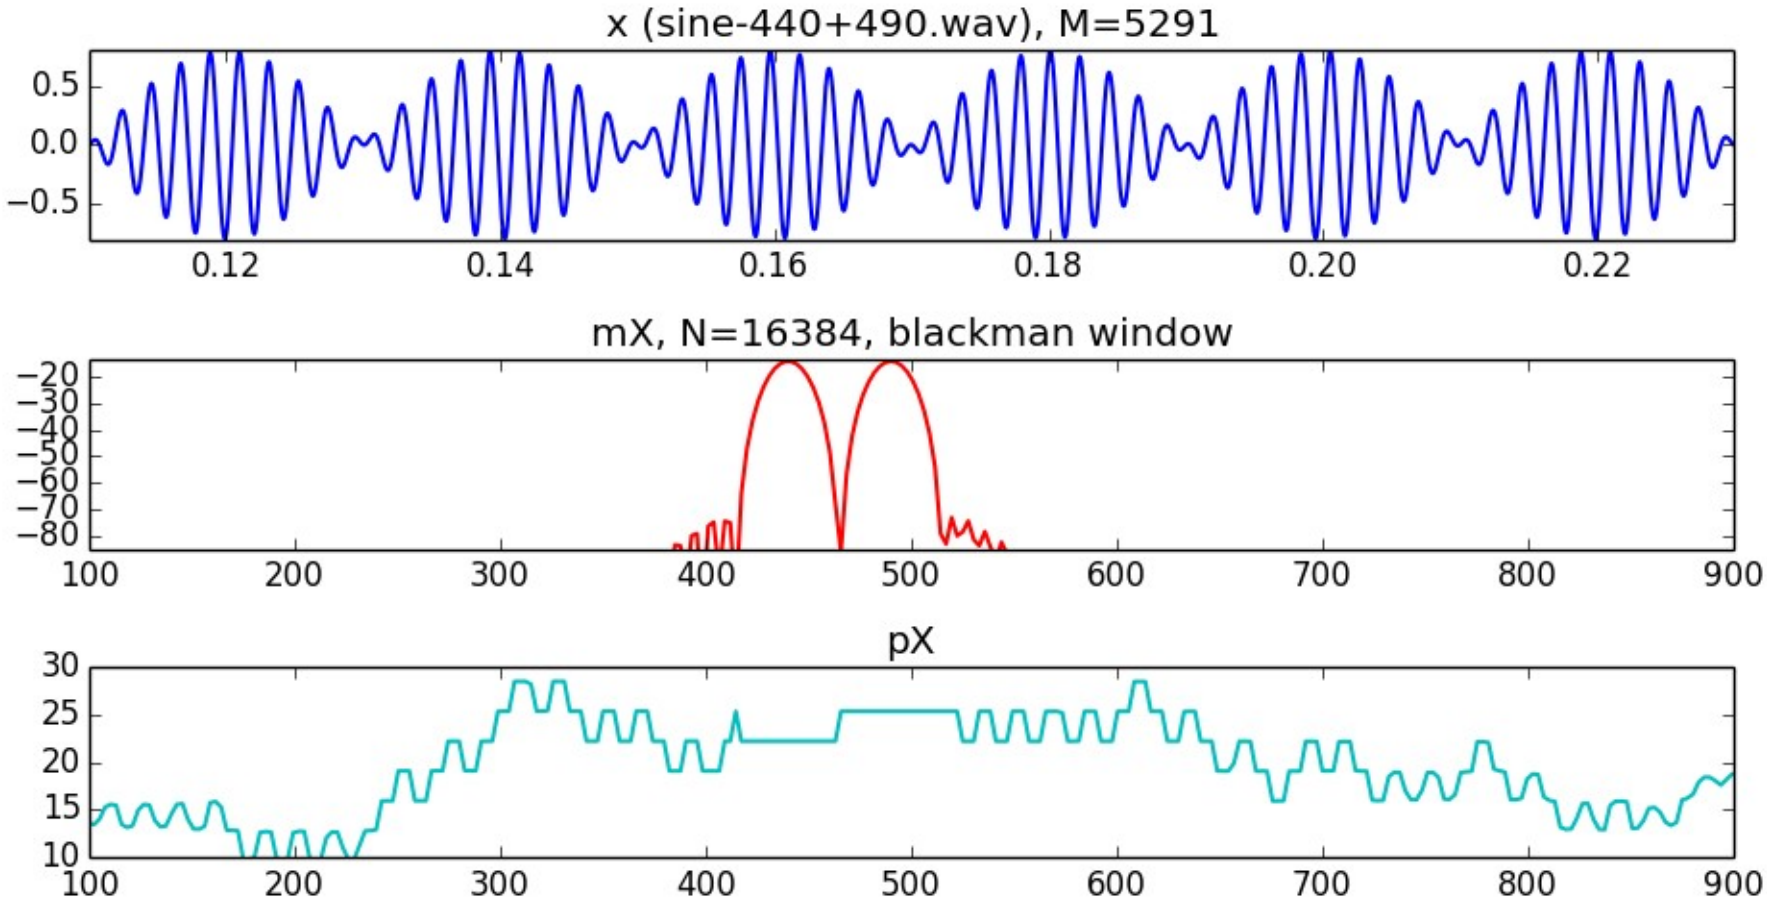
Index

- Sinusoidal model
- Peak detection
- Time-varying sinewaves in spectrogram

Sinusoidal model

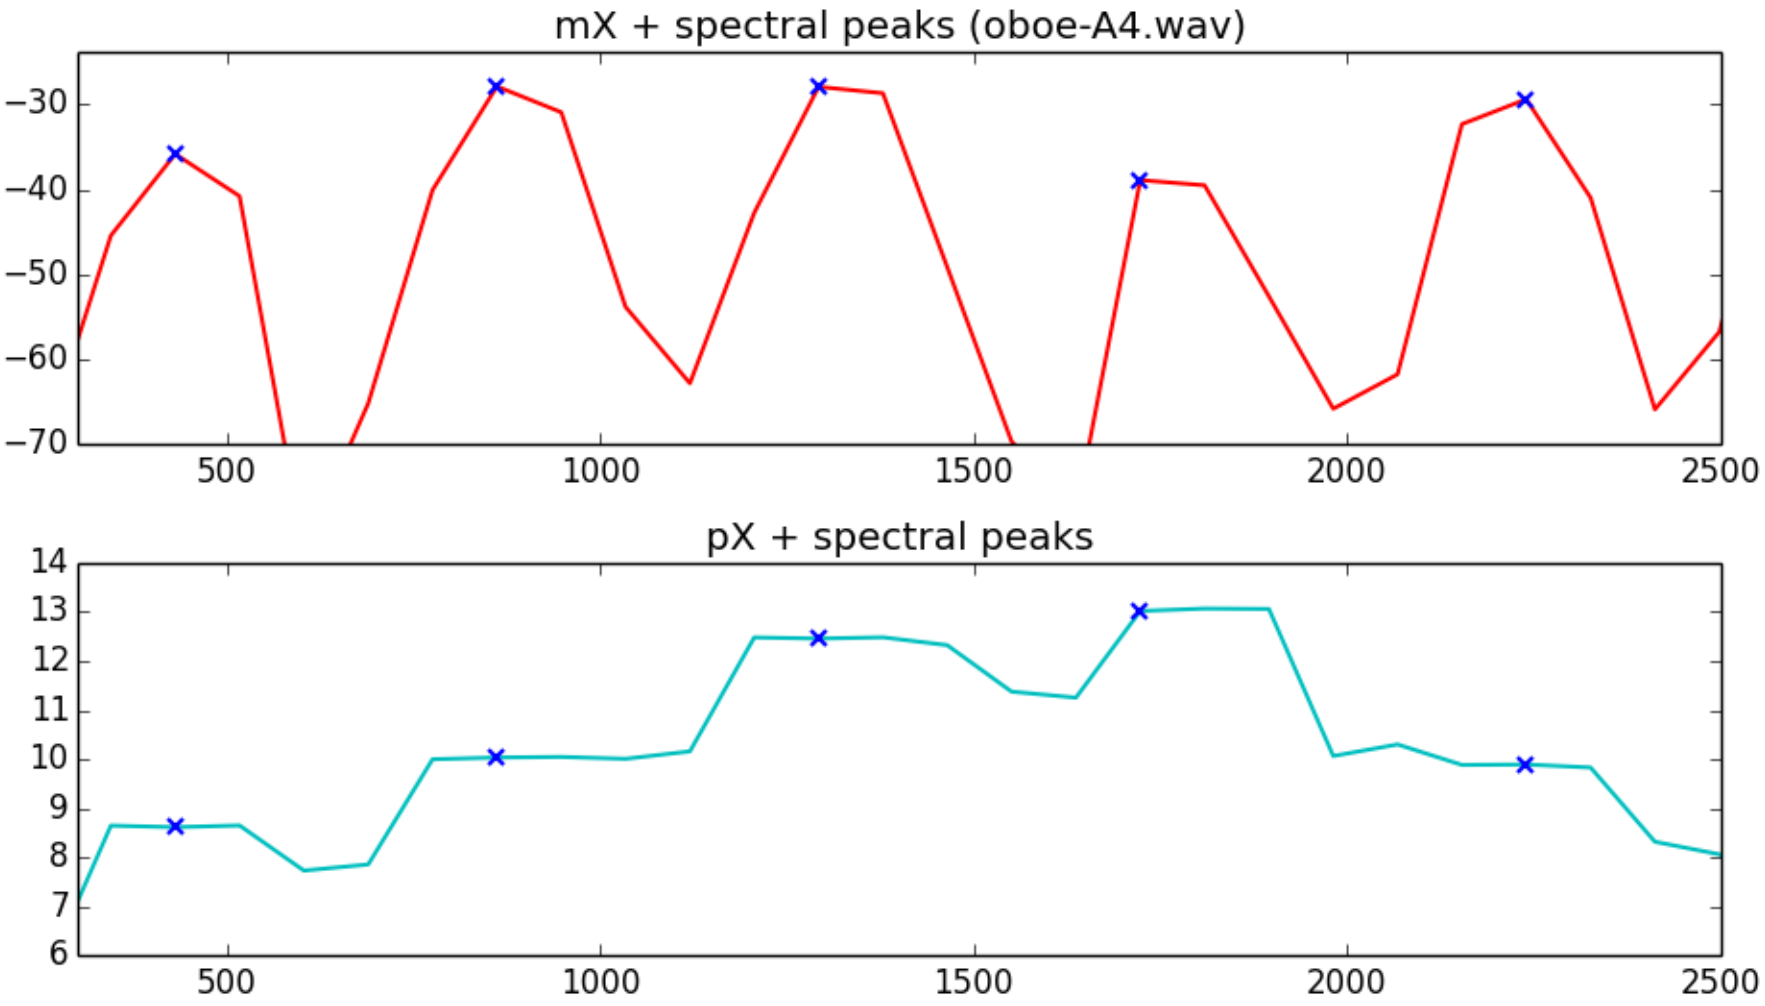
$$y[n] = \sum_{r=1}^{R} A_r[n] \cos\left(2\pi f_r[n] n\right)$$



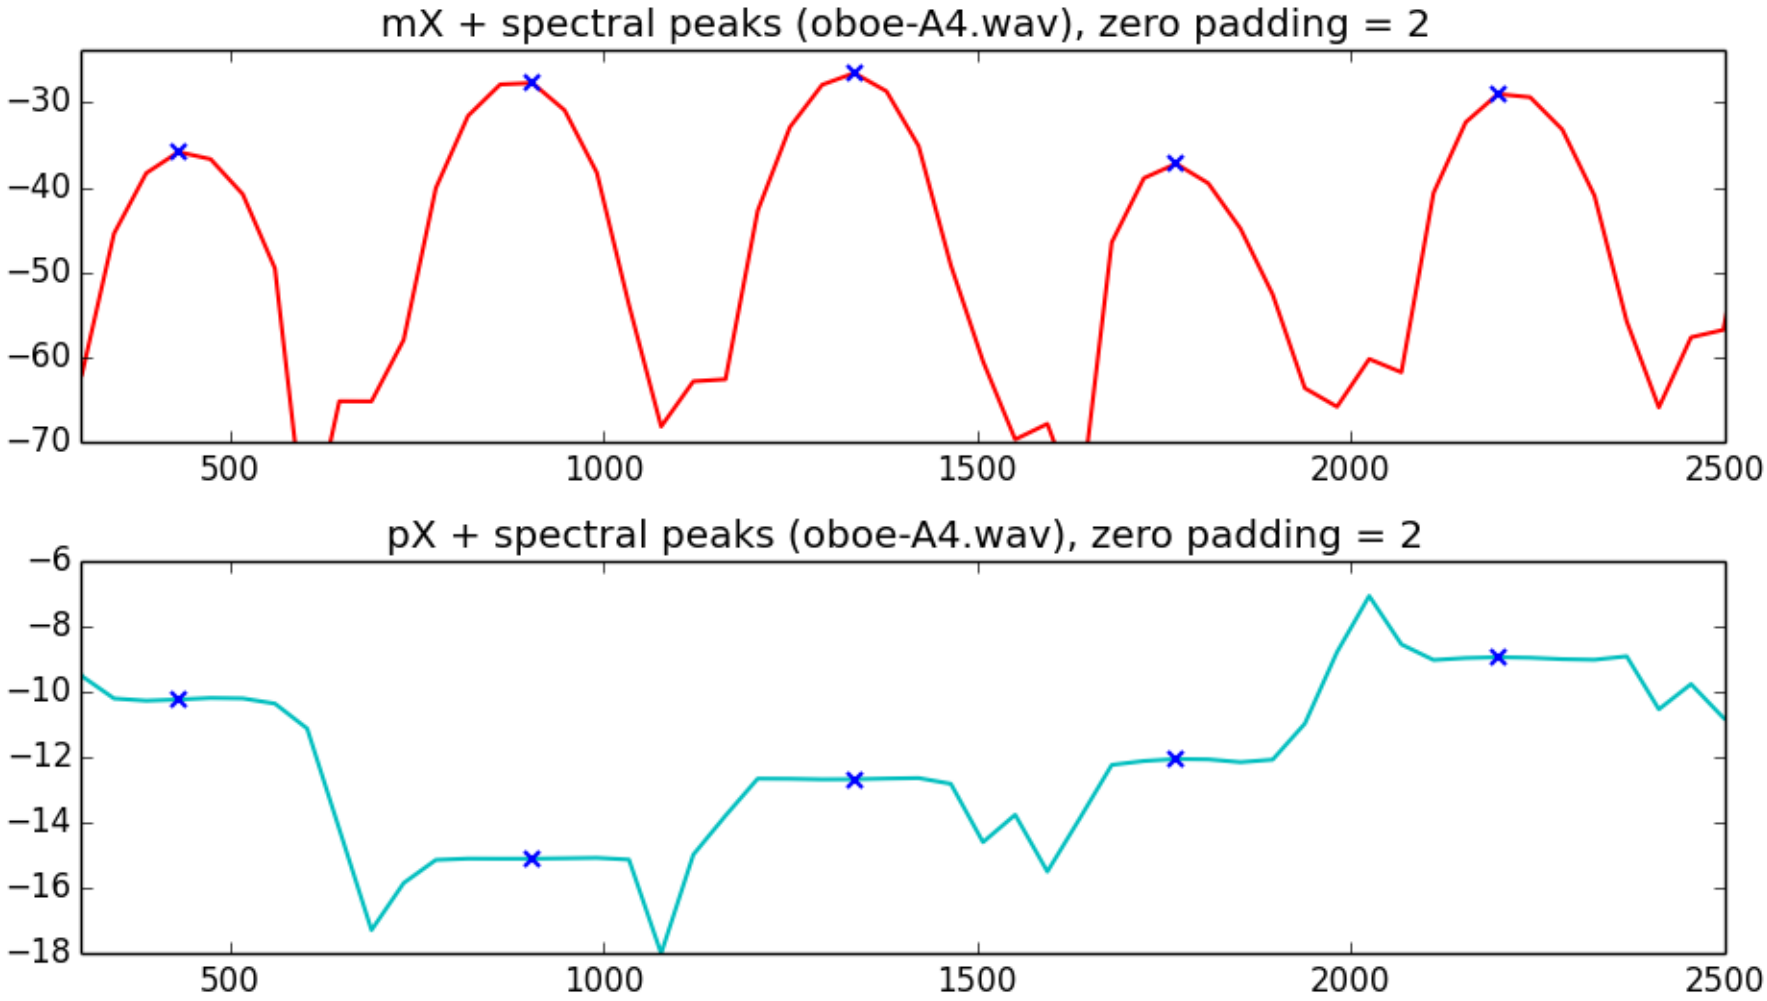
Peak detection

$p_r = mX[k_0]$ when $mX[k_0 - 1] < mX[k_0] > mX[k_0 + 1]$

mX = magnitude spectrum ; r = peak number ; k_0 = peak location



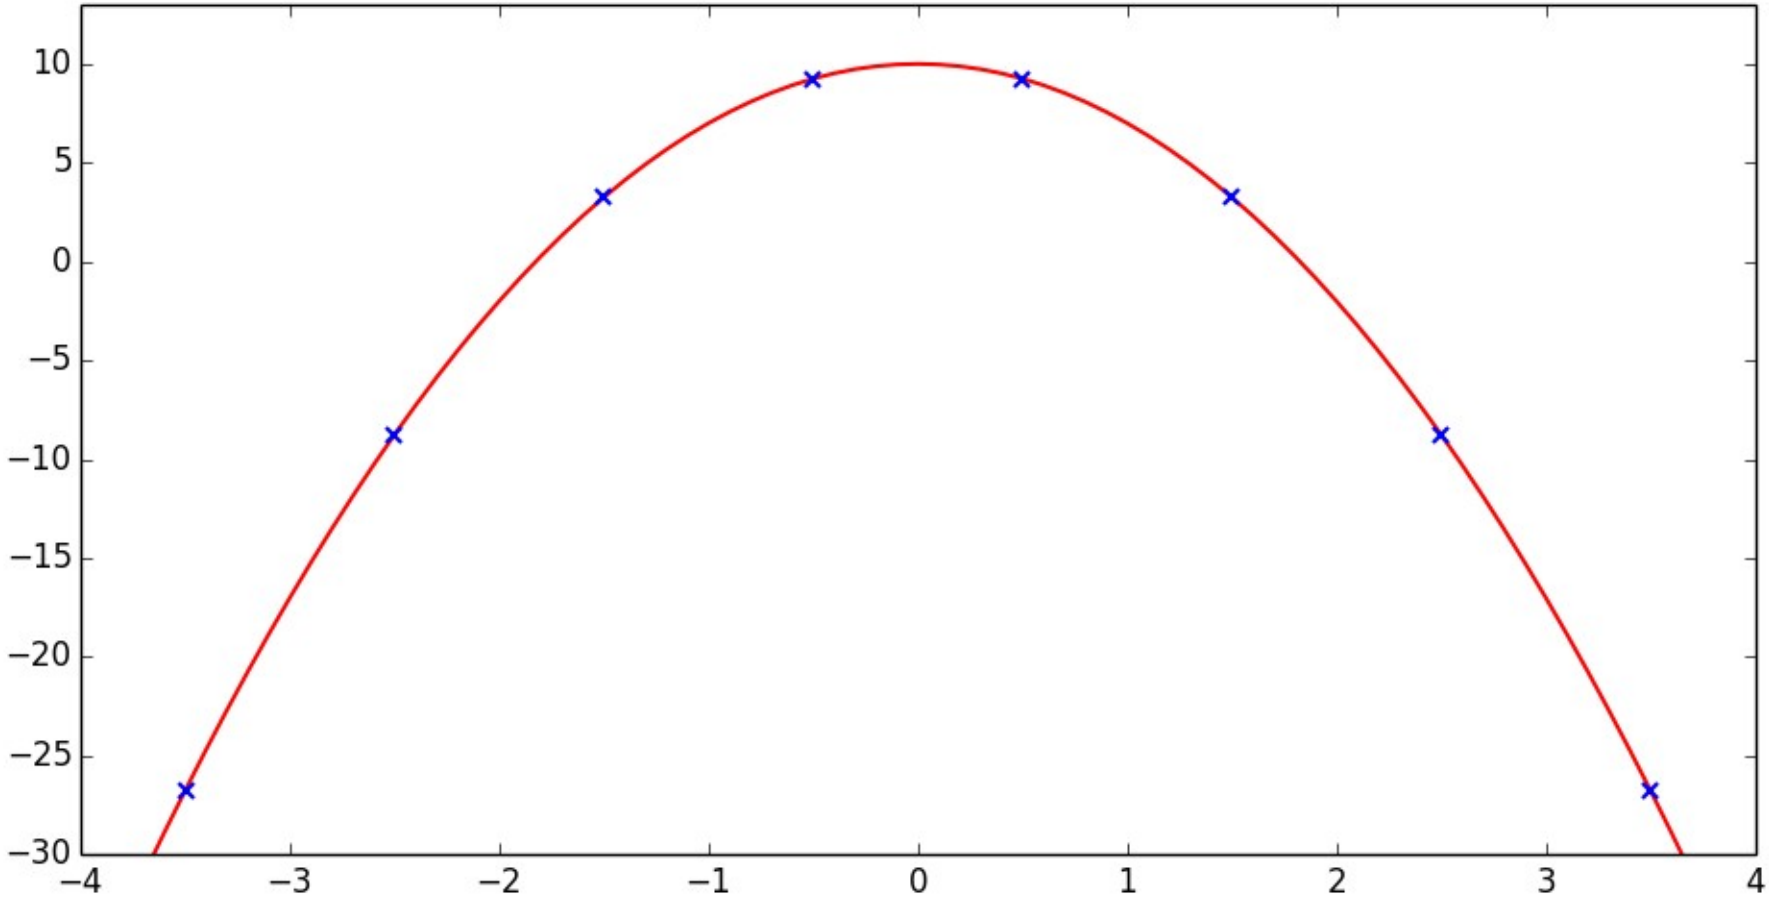
Peak detection with zero-padding



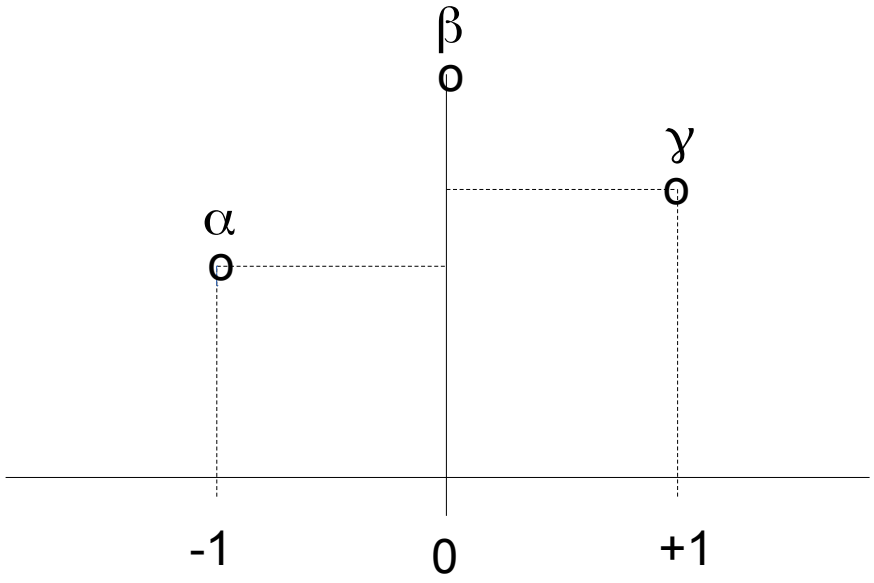
Parabola

$$x[n] = a(n-p)^2 + b$$

p: center of parabola
a: concavity measure
b: offset



Peak interpolation

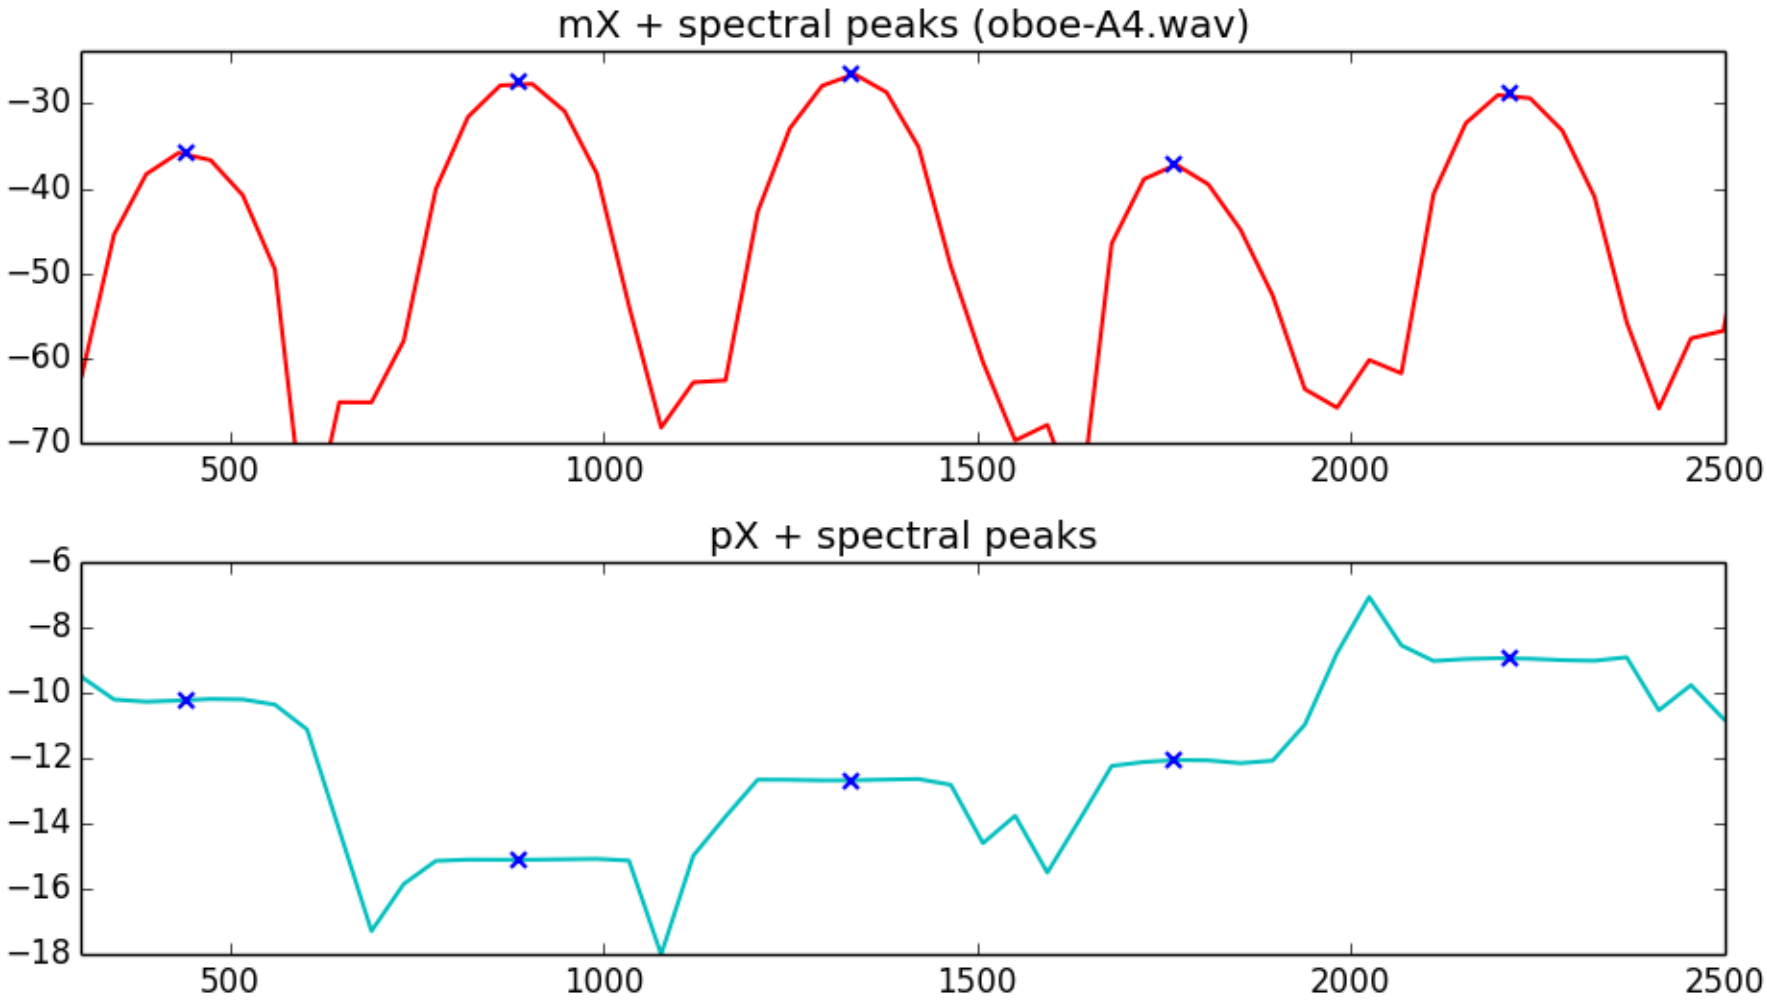


$$x[-1] = \alpha = mX[k_\beta - 1]$$
$$x[0] = \beta = mX[k_\beta]$$
$$x[1] = \gamma = mX[k_\beta + 1]$$

center of the parabola: $\hat{k}_p = \hat{k} + \frac{\alpha - \gamma}{2}(\alpha - 2\beta + \gamma)$

amplitude: $\hat{a} = \beta - \frac{\hat{k}_p}{4}(\alpha - \gamma)$

Peak detection with interpolation



Sinusoidal parameters from peaks

$$\hat{k}_p = |X[k_p]| + \frac{0.5 * (|X[k_p - 1]| - |X[k_p + 1]|)}{|X[k_p - 1]| - 2 * |X[k_p]| + |X[k_p + 1]|}$$

$$f_p = \frac{f_s * \hat{k}_p}{N}$$

$$A_p = |X[k_p]| - 0.25 * (|X[k_p - 1]| - |X[k_p + 1]|) * (\hat{k}_p - k_p)$$

$$ph_p = \measuredangle X[\hat{k}_p]$$

Sinewaves in spectrogram

- Sinusoid → **stable** peak track in spectrogram
- Stability identified by
  - frequency and amplitude in succesive frames
  - phase derivative in time/freq

Condition for a peak f_p of frame l to be part of a track t :

$$f_p[l] = f_t[l] \quad \text{if} \quad \left(|f_p[l] - f_t[l-1]| < threshold\right)$$
$$\text{and if exists} \quad f_t[l-2], f_t[l-3], \ldots, f_t[l-L]$$
